

Installation of JGY 1.6L B14 style fuel rail.

Note the location of the brackets. It is important that the fuel injectors are mounted at 90 degree angles to the injector holes in the manifold. The JGY 1.6L B14 fuel rail is equipped with a separate FPR allocation adaptor to allow the customer to mount it before or after the rail as the throttle body is in the way. Please use the appropriate flexible fuel hose to join the pieces. Don't forget that the regulator goes in-line after the fuel passes the injectors.
